Installing software from Company Portal / Software Center

Article KB0010055 | Owner: Application Support | Subcategory: Software installation | Applies to: Windows 11 (23H2/24H2) on Dell Latitude 5440/7440, Lenovo ThinkPad T14/X1 Carbon, HP EliteBook 840, macOS 14/15 on MacBook Pro/Air, Devices enrolled in Microsoft Intune and compliant with company policies, Both on-site (connected to ACME-Corp Wi-Fi or wired LAN) and remote users connected via GlobalProtect VPN

Summary

KB0010055 provides guidance for end-users and service-desk agents on installing approved applications through the Company Portal (Microsoft Intune) or Software Center at Acme Global. It outlines prerequisites, common symptoms, self-help steps, and the agent workflow for fulfilling software requests, including when to escalate for unapproved or packaged applications.

Symptoms

- Company Portal or Software Center shows the requested application as 'Not available' or 'Not applicable'
- Error code 0x80070005 (Access denied) when attempting to install
- Error code 0x87D00324 (The app is not applicable for this device)
- Installation appears to start but fails with 'Installation failed - please try again later'
- No prompt for approval; the app remains in 'Pending' state

Common causes

- Device is not enrolled in Intune or is out of compliance
- User lacks the required license or entitlement for the application
- Application is not on the approved software catalog and requires security review
- Network connectivity issue preventing the device from reaching Intune service (e.g., VPN disconnected, Wi-Fi not authenticated)
- Intune client or Company Portal app is outdated or corrupted
- Pending approval workflow where the request awaits action from Application Support or Security

Before You Begin

Ensure the device is powered on, connected to the corporate network (ACME-Corp Wi-Fi or Ethernet) or, if remote, that the GlobalProtect VPN tunnel is active. Verify that the Company Portal app is installed and up to date, and that you can sign in with your Acme Global credentials using MFA. Close any other installation wizards or software update windows that might conflict with the new install.

Self-Help: Install Approved Software via Company Portal

Most approved applications are published directly to the Company Portal and can be installed by the user without administrator intervention. If the software you need appears in the portal, follow the steps below to install it yourself. If the app is missing or marked as unavailable, you will need to request it through the service desk (see the Agent Procedure section).

1. Connect to ACME-Corp Wi-Fi or launch the GlobalProtect VPN client and confirm you have internet access.
2. Open the Company Portal app (Windows: Start -> Company Portal; macOS: Applications -> Company Portal) or browse to https://portal.manage.microsoft.com.
3. Sign in with your Acme Global username and password; approve the MFA push in Microsoft Authenticator or enter the SMS code you receive.
4. In the search box, type the name of the software you require (e.g., "Python", "Adobe Reader", "Visual Studio Code").
5. If the application appears in the results, select it and click the Install button. Watch the status bar; most installs finish within a few minutes.
6. After the installation completes, launch the program from the Start menu (Windows) or Applications folder (macOS) to confirm it works correctly.
7. If the app does not appear, shows as 'Not available', or returns an error, proceed to request the software via the service desk (see the Service Desk Procedure section).

Service Desk Procedure: Handling Installation Requests

Agents follow a structured workflow to verify eligibility, attempt a remote push, and, when necessary, arrange an admin-session install or initiate a security review. The goal is to fulfill the user's request while adhering to Acme Global's software-approval and licensing policies.

1. Open or create the ticket, capturing the user's name, device hostname, operating system, and the exact software title and version requested.
2. Confirm the device is Intune-enrolled and compliant: ask the user to run dsregcmd /status on Windows or profiles status on macOS, or check the device inventory in the Intune portal.
3. Search the approved software catalog in Intune/Company Portal for the requested title. Note the assigned groups and any dependency requirements.
4. If the app is approved and already assigned to the user's device group, trigger a reinstall via Intune (Device -> Actions -> Sync) and monitor the installation status in the Device actions log.
5. If the application is not approved, verify whether a temporary exception exists; if not, inform the user that a security review is required and create a request in the Security team's queue, attaching the ticket number, justification, and any license information.
6. For packaged or legacy Win32 apps that are not available through Intune, schedule an admin session using Remote Help, PsExec, or another approved tool to install the software locally, then record the installation in the CMDB and notify the user.
7. Close the ticket after confirming the software launches successfully, documenting the installed version, any license key applied, and noting whether a future renewal or patch is required.

Verification and Confirmation

Both users and agents should verify that the installed software functions as expected and that no error messages remain. Users can check the program's version via its About dialog or help menu. Agents can review Intune installation logs, Event Viewer logs (Windows), or Console logs (macOS) to confirm a successful install and detect any residual issues.

When to escalate

Escalate to Application Support (or Security) when: the requested software is absent from the approved catalog and requires a security review; installation repeatedly fails with error codes 0x80070005 or 0x87D00324 despite retries; the device is non-compliant and cannot be brought into compliance remotely; or a licensed application needs manual activation that exceeds the help-desk scope. When escalating, include the device hostname, Intune compliance status, exact error codes and messages, screenshots of Company Portal/Software Center showing the issue, and any relevant license or version details.
