Setting up work email on your phone (Intune)

Article KB0010079 | Owner: Desktop Support | Subcategory: Mobile email / MDM | Applies to: Android 8.0+ (or later) smartphones, iOS 13+ iPhones, Corporate-owned or BYOD devices managed by Intune

Summary

This article guides Acme Global employees through enrolling their personal or corporate smartphone in Microsoft Intune so that the Outlook mobile app can sync work email. It covers prerequisites, step-by-step enrollment, common troubleshooting, verification, and the exact actions the Desktop Support team should take when assisting users.

Symptoms

- Outlook mobile app shows a message: "Your organization requires you to secure this device before accessing company data."
- Company Portal app reports enrollment failure with error codes such as 0x8018000a or "Device not compliant".
- No Acme Global email account appears in Outlook; only personal accounts are listed.

Common causes

- Device is not enrolled in Intune or enrollment was interrupted.
- Device does not meet compliance requirements (missing PIN, outdated OS, jailbreak/root).
- Conditional Access policies block access because the device is not marked compliant.
- Company Portal app is outdated or missing required permissions.

Before you start

Ensure you have a stable internet connection (Wi-Fi or cellular) and that your phone meets the minimum OS version (Android 8.0 or iOS 13). Have your Acme Global username (firstname.lastname@acme.example) and password ready. If you are using a personally owned device, make sure you are willing to allow Intune to enforce a device PIN and basic compliance settings.

Enroll your device in Intune and set up Outlook

Follow these steps to enroll the phone in Intune, satisfy compliance, and add your work Outlook account. The process is the same for Android and iOS, with minor UI differences noted.

1. Open the Google Play Store (Android) or App Store (iOS) and search for "Company Portal". Install the app.
2. Launch Company Portal and sign in with your Acme Global email address and password.
3. When prompted, allow the app to collect device information and to manage your device.
4. Follow the on-screen instructions to set a device PIN (minimum 6 digits) if you do not already have one; this satisfies Intune's compliance policy.
5. After enrollment completes, you will see a confirmation screen stating "Device is compliant".
6. Open the Outlook app (install from the store if not present). Choose "Add Account" -> "Office 365".
7. Enter your Acme Global email address; Outlook will detect the Intune-managed account and redirect you to the Company Portal for authentication.
8. Approve the sign-in request in Company Portal (or enter your password again if prompted). Outlook will then begin syncing your mailbox, calendar, and contacts.
9. Wait a few minutes for the initial sync to finish; you should see your Inbox populate with work email.

Common issues and quick fixes

If you encounter any of the symptoms listed above, try these corrective actions before contacting the Service Desk.

1. Verify device compliance: Open Company Portal -> Devices -> select your phone -> check the compliance status. If it shows "Not compliant", tap "Resolve issues" and follow the prompts (usually to set a PIN or update OS).
2. Update the Company Portal and Outlook apps to the latest version from the store.
3. Restart the phone, then reopen Company Portal and sign in again; sometimes a transient token error clears after a reboot.
4. If enrollment still fails, uninstall Company Portal, reboot, reinstall, and repeat enrollment from step?1.
5. For Android, ensure that "Install unknown apps" is disabled for Company Portal unless you explicitly need it; for iOS,

verify that the device is not jailbroken.
6. If you receive an error code 0x8018000a, note that it indicates a blocked access due to Conditional Access; confirm that the device is marked compliant in Intune (see step?1) and that you are not attempting to access email from a non-approved app.

Verify email is working

After completing enrollment and adding the Outlook account, confirm that everything is functioning as expected. Open Outlook and look for your Inbox, Sent Items, and Calendar. Send a test email to yourself and verify that it arrives within a few minutes. Check that you can open attachments and that outbound messages show your Acme Global signature.

Service Desk procedure (Desktop Support)

When a user reports missing work email or Intune enrollment failure, follow this workflow to resolve the issue quickly and document the outcome.

1. Ask the user to confirm device model, OS version, and whether the device is personally owned or corporate-owned.
2. Verify that the user can sign in to the Company Portal web portal at https://portal.azure.com (or https://companyportal.acme.example) using their Acme credentials; if they cannot, reset the password via https://passwordreset.acme.example.
3. Guide the user through the enrollment steps outlined in the Self-help section (steps?1-9) while you stay on the call or Teams chat.
4. If the device shows as non-compliant in Intune, instruct the user to set a device PIN (or upgrade OS) and re-check compliance.
5. Once enrollment succeeds, have the user open Outlook and add the Office 365 account; confirm that mail begins to sync.
6. Request the user to send a test email to themselves and verify receipt.
7. Close the ticket, noting the final compliance state, app versions used, and any workaround applied.

Escalation path

If after following the Service Desk procedure the device remains non-compliant, shows repeated enrollment errors (e.g., 0x8018000a, 0x80070005), or the user reports that the device is rooted/jailbroken and cannot be brought into compliance, escalate to the Identity & Access Management (IAM) team for a Temporary Access Pass or to investigate Conditional Access policies. Include the device ID, error logs from Company Portal, screenshots of the compliance status, and the user's UPN.

When to escalate

Escalate to the Identity & Access Management (IAM) team when Intune enrollment repeatedly fails despite compliance remediation, when the device is rooted/jailbroken, or when Conditional Access blocks access despite a compliant device. Provide the device's Intune ID, the exact error code(s) from Company Portal, screenshots of the compliance page, and the user's UPN so IAM can issue a Temporary Access Pass or adjust policies.
