Mobile device compliance requirements

Article KB0010080 | Owner: Desktop Support | Subcategory: Mobile email / MDM | Applies to: iOS 13.0 or later, Android 8.0 (Oreo) or later, Microsoft Outlook mobile app, Intune Company Portal app

Summary

This article explains the mobile device compliance requirements for accessing Acme Global corporate email and resources via Outlook mobile. It outlines the prerequisites for Intune enrollment, the device settings that must meet compliance (such as PIN/passcode, encryption, OS version, and no jailbreak/root), and provides step-by-step guidance for both end-users and service-desk agents to achieve compliance and restore email access.

Symptoms

- Outlook mobile displays a message: "Your device doesn't meet your organization's security standards" or "Please secure your device to continue using company email"
- Company email fails to sync or shows a blank inbox after adding the account
- Intune Company Portal reports enrollment failure with error codes such as 0x8018000a, 0x80070005, or 0x80072ee2
- Device is blocked from accessing SharePoint, OneDrive, or Teams mobile apps

Common causes

- Device not enrolled in Intune or enrollment incomplete
- Missing or insufficient device passcode/PIN (less than required length or complexity)
- Device encryption not enabled (BitLocker on Windows, FileVault on macOS, or built-in storage encryption on iOS/Android)
- Operating system version below the minimum supported level
- Device is jailbroken (iOS) or rooted (Android) or has tampered security controls
- Corporate Wi-Fi or VPN connection preventing Intune communication

Prerequisites and Quick Checks

Before starting enrollment, verify that the device meets the basic hardware and software requirements. Ensure you have a stable internet connection (Wi-Fi or cellular) and that you can receive push notifications or SMS for MFA if prompted. Locate the Intune Company Portal app in the Apple App Store or Google Play Store and have your Acme Global credentials (username@acme.example and password) ready.

Self-Help Procedure for Users

Follow these numbered steps to enroll your mobile device in Intune, set a compliant passcode, and regain access to company email. The process typically takes 5-10 minutes.

1. Install the Intune Company Portal app from your device's app store.
2. Open the app and sign in with your Acme Global email address and password.
3. If prompted, approve the sign-in request using Microsoft Authenticator push or enter the SMS code you received.
4. The app will begin evaluating device compliance. If any requirement is missing, it will show a specific message (e.g., "Set a device passcode").
5. To set a compliant passcode: go to Settings -> Security -> Screen lock (Android) or Settings -> Face ID & Passcode (iOS). Create a PIN or password that is at least 6 characters long and includes a number; longer or more complex passwords are encouraged.
6. Return to the Company Portal app and tap "Check compliance" again. The app should now report that the device is compliant.
7. Open Outlook mobile, add your Acme Global account if it is not already present, and wait for synchronization to complete. You should see your inbox populate within a few minutes.

Service Desk Agent Procedure

When a user reports mobile email access issues, use this procedure to verify enrollment status, diagnose compliance failures, and guide the user to resolution. Document each step in the ticket.

1. Ask the user to confirm device make, model, and OS version. Record this information in the ticket.

2. Request that the user open the Intune Company Portal app and navigate to the Devices tab to see the enrollment status and any compliance errors displayed.
3. If the device shows "Not enrolled", guide the user through the self-help enrollment steps above, staying on the line or in Teams chat to assist with authentication.
4. If the device is enrolled but non-compliant, note the specific compliance failure (e.g., missing passcode, outdated OS, encryption off, jailbreak/root detected).
5. Provide the exact remediation action: set a device passcode meeting the 6-character minimum, update the OS to the latest supported version, enable storage encryption, or remove jailbreak/root (note that rooted/jailbroken devices may need to be restored to factory state before re-enrollment).
6. After the user makes the change, ask them to re-run the compliance check in the Company Portal and confirm the status changes to "Compliant".
7. Finally, have the user launch Outlook mobile and verify that email syncs successfully. Close the ticket with a resolution note summarizing the actions taken.

Verification and Confirmation

Once compliance is achieved, verify that the user can access all required corporate resources. This ensures the issue is fully resolved and reduces the chance of recurrence.

1. Confirm that Outlook mobile shows recent emails and that sending/receiving works.
2. Check that OneDrive and Teams mobile apps open without prompting for additional security actions.
3. Optionally, have the user visit the Intune Company Portal and view the device compliance dashboard to see a green "Compliant" status.
4. Inform the user that the device will be re-evaluated periodically (typically every 8 hours) and that they should maintain the passcode and keep the OS updated to remain compliant.

Additional Tips and Best Practices

Share these recommendations with users to prevent future compliance problems and to keep their devices secure in line with Acme Global policy.

1. Enable automatic OS updates so the device stays within the supported version range.
2. Use a unique, strong device passcode and avoid simple patterns or repeated numbers.
3. Do not install apps from unknown sources or enable developer options that could compromise device integrity.
4. If the device is lost or stolen, immediately report it to the IT Service Desk so a remote wipe can be initiated via Intune.
5. Remember that compliance requirements apply to any device used to access Acme Global email, including personal smartphones and tablets.

When to escalate

If the user's device remains non-compliant after following the self-help and agent procedures, or if the enrollment repeatedly fails with error codes indicating network or certificate issues (e.g., 0x80072ee2, 0x80092004), escalate to the Identity & Access Management (IAM) team. Provide the ticket with: device make/model, OS version, exact error codes from the Company Portal, screenshots of the compliance failure screen, and any relevant network details (Wi-Fi SSID, VPN status). The IAM team can investigate conditional access policies, device compliance policies, or certificate-based VPN issues that may be blocking Intune communication.
